In the Specification:

Please replace paragraph [0054] at pages 8-9 with the following replacement paragraph showing changes relative to the previous version of said paragraph.

[0054] A preferred embodiment of the invention is illustrated in Figures 9-12. As shown, the hood portion 12 is generally planar, and made of highly compact, modular components. Furthermore, this embodiment may be installed on an assembly line so the radiation is emitted downward. However, it may also be flipped or inverted so that the radiation is emitted upward and a bottom surface of food may be sanitized. For this purpose, the top of the hood portion 12 preferably includes drainage holes 78, in case liquid accumulates onto or into the hood portion 12 during operation. In addition, as shown in Figure 10, the hood portion 12 also preferably includes a downward bent lip 80 to help contain the sanitizing agents and minimize exposure to users.
